Dolphin RFID Maintenance - A Green Initiative

Unknown to us we are unconsciously wasting precious nature's resources in conceiving and using elaborate planned preventive maintenance and breakdown maintenance systems which use millions of tons of paper – which in turn translates into avoidable use of wood pulp. As a green initiative Dolphin RFID has created a totally paperless maintenance management system which does away with the need of paper as also is a highly productive system which improves both the top line (by preventing breakdown) and bottom line (with increased profits) for enlightened entities. A patent has been applied for this system.
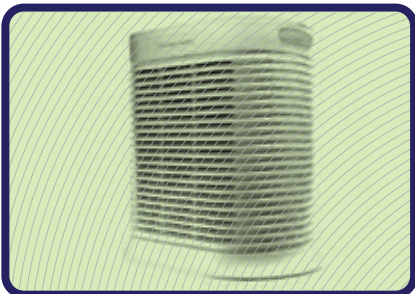

What is RFID technology ?

Radio Frequency identification is an emerging technology which helps automate the existing manual/semi-automated processes. Dolphin RFID is a company which is fully dedicated to providing end-to-end RFID solutions and helping maintain them through the lifecycle. Dolphin RFID systems help integrate varied RFID readers from technology leaders and also integrates with the existing applications (including ERPs) thus making it simple for the end users to assimilate the technology.

Fully Automated RFID Solutions for Dolphin RFID Maintenance

A fully Green initiative as it does takes away loads of paper work and the need to manually upload data into servers for keeping a track of the maintenance done. Dolphin RFID is redefining the way maintenance has been done for centuries and bringing in simplicity by use of RFID – a real breakthrough which has revolutionized the way maintenance is done.

Our I – Maintenance solution collects required data by end user/ site engineer thereby also sending required work details via automated report to respective authorities. The end user can monitor each task process by Android Admin Panel which greatly improves quality of service provided.

Your operations could be limited to a building complex, a city, a region or may be global – Dolphin RFID's I – Maintenance System will help you change your way of thinking as to how maintenance needs to be tracked to ensure elimination of unplanned work necessitated due to breakdowns. And an Admin Panel permits the Supervising Engineer to keep a track of work schedule as also the work completed by the engineers in the field in real time – fully automated feedback with no human intervention.

Features

◆ Android Based RFID System

◆ Extremely cost effective

◆ Works on a 2G/3G/Wi-Fi Network

◆ Keeps track of work done by Maintenance Staff

◆ Real time update of asset management information

◆ Ability to capture signatures, GPS location & Photographs

◆ Asset Maintenance History at the touch of a button on the server and mobile

◆ Totally Paperless Real Time Solution - Green Initiative

Useful For:

◆ DOD

◆ Power Utility

◆ Service Oriented

◆ Manufacturing

◆ Infrastructure

◆ Remote Data Collection
